

Follow the maintenance instructions below to help preserve the fire-retardant properties, visual quality and long-term performance of SPFR100-treated surfaces.

Maintenance steps

Step	Action	Notes
Inspection	Inspect the surface at least once a year. Check for scratches, cracks, wear, soiling and moisture damage.	<i>Pay special attention to surfaces exposed to UV radiation, moisture and mechanical wear.</i>
Cleaning	Remove dust, dirt and organic residues with a soft brush, cloth or low-pressure water.	<i>Do not use abrasive materials, high-pressure washing, strong chemicals or solvents.</i>
Repair of damage	In case of mechanical damage, clean the damaged area and reapply SPFR100.	<i>Use the same product and follow the SPFR100 technical data sheet and application instructions.</i>
Cut and drill areas	After cutting, drilling or other machining, apply SPFR100 to the exposed wood surfaces.	<i>Avoid prolonged exposure of untreated cut surfaces to moisture and outdoor conditions.</i>
Additional coatings	Consult Solid Protect before applying lacquers, paints, oils, waxes or other finishing products.	<i>An unsuitable coating may affect the performance of SPFR100 and the fire classification.</i>

Interval and conditions

<p>Maintenance interval</p> <p>Inspection: at least once a year.</p> <p>Maintenance: typically every 5–10 years, depending on weather, moisture, UV and usage load.</p> <p>Maintenance coat: 120–140 ml/m².</p> <p><i>Apply the maintenance coat to a clean, dry surface with a brush, roller or suitable spray system.</i></p>	<p>Maintenance conditions</p> <p>Air temperature: +15...+50 °C</p> <p>Relative humidity: 20–60%</p> <p>Wood moisture content: 10–18%</p>
